

Active Directory Deployment the Maplewood Trusted Root Certificate

1. Download the certificate file from the link at the bottom of the instructions.
2. From Administrative Tools open Group Policy Management
3. In an appropriate location of your AD Forest create a new policy called “Deploy Maplewood Hosting Trusted Root Certificate” (this needs to apply to all the computers that your users will access our servers from).
4. Edit the policy “Deploy Maplewood Hosting Trusted Root Certificate” – Computer Configuration / Policies / Windows Settings / Security Settings / Public Key Policies
5. Click on Trusted Root Certification Authorities then right click and select import.
6. Browse to the certification file downloaded in step one (ensure you have Personal Information Exchange (*.pfx; *p12) selected in the file type drop down.
7. The wizard will prompt you to enter a password “Hosting2014” and also ensure you check “Mark this key as exportable. This will allow you to back up or transport your keys at a later time.” And “Include all extended properties.”
8. Please leave the default location “Trusted Root Certification Authorities” selected.
9. You will now need to wait the appropriate length of time for this policy to apply to all your computers.

Once the policy has been applied you should see a record listing hosting.maplewood.com in the Local Computer Certificate Store.
